

Canada has the assets. It is missing the bridge. We are building it.

4orm is the regulated settlement layer and marketplace that connects Canada's real-world-asset issuers, custodians, and tokenization projects to institutional liquidity and the country's banks.

The question is no longer whether tokenized finance works in Canada. It is who builds the layer that makes it run.

THE 30-SECOND VERSION

Canada has real innovation in tokenized finance, but it lives in small, disconnected pockets: credible issuers in real estate, private credit, energy, mining, and metals; tokenized-deposit infrastructure; qualified custodians. What is missing is the bridge between them and institutional capital. 4orm is that bridge. We are the regulated settlement layer and marketplace that connects Canada's asset issuers to the banks, the buy-side, and the liquidity that gives their value reach. Not another exchange. The infrastructure the whole market runs on.

THE 60-SECOND VERSION

There is no shortage of good assets or good technology in Canada. There is a shortage of connection. Issuers with real value in real estate, private credit, and natural resources cannot reach institutional buyers, so their assets sit illiquid. The custodians, the tokenized deposits, and the regulation already exist, but nothing ties them together into a market.

4orm is the institutional infrastructure that lets Canada run tokenized finance at scale, safely: digital settlement, tokenized CAD deposits, real-world-asset issuance and registry, and a regulated marketplace, built end to end for Canadian rules. We do not build the assets. We build the layer that gives every issuer reach and every institution access.

The timing is not an accident. Canada has now proven tokenized settlement works: the Bank of Canada's tokenized bond trial settled end to end in central-bank money. The question moved from "if" to "who builds it." Picture Canada, the fourth-largest resource nation on earth, turning a fraction of that value into regulated, liquid instruments, without selling the asset. That is the market 4orm connects.

Project Samara is directional industry proof, not a 4orm result. No regulator has reviewed, endorsed, or approved 4orm.

ONE-LINERS YOU CAN DROP ANYWHERE

- Canada has the assets and the custodians. We build the bridge to institutional liquidity.
- 4orm is the settlement layer that connects real-world-asset value to Canada's institutions.
- Not another exchange. The infrastructure the market runs on.

HOW TO LAND IT • VOSS AND HUGHES

- ☐ **Start in their world.** Name the gap they already feel: good assets, no liquidity. Say it as a fact, then stop talking. Label it, and let the silence work.
- ☐ **Ask, do not tell.** "How would an issuer reach institutional buyers in Canada today?" Let the question expose the gap for them.
- ☐ **Speak with certainty.** State what Canada is missing as fact, not opinion. Calm authority reads as truth.
- ☐ **Future-pace the upside.** "Imagine a fraction of Alberta's resource base, liquid and regulated." Let them see it before you explain it.
- ☐ **Go for "that is right," not "you are right."** When they say the gap back to you, you have them. End on the bridge, not the features.

THE LINE WE ALL BELIEVE

We are building the layer that Canadian tokenized finance will run on.
